

ABSTRACT

The invention relates to an improved urine collector for female use. The inventive collector comprises a body which is triangular in plan and which is made from an elastomer material. According to the invention, the body is equipped with: a first recess (3) which is disposed at the end of the peripheral flange (2) thereof, said recess (3) being defined by two lateral tongue elements; and a second recess (4). Moreover, a tubular projection (7) is provided in the lateral zone of said second recess. The aforementioned recess (4) also comprises a zone (8) which adopts the form of a bellows or fold.
